Chatbots will continue to transform virtually every business function, from marketing and sales to customer support. One of the other areas that we will see a major transformation is human resources (HR).

HR teams have a very challenging job with seemingly conflicting objectives: keeping employees focused and working hard while also keeping them happy and satisfied.

More successful

HR teams are often held accountable for employee retention and churn, without the ability to manage them directly. HR is expected to have a finger on the pulse of a large employee base while operating with a very small team.

HR teams find that their responsibilities are vast and the goals are high. There is rarely enough time or resources to do justice to it all.

A lot of their time is invested in managing routine processes, which impacts the focus on higher priority activities.

Teams have limited time left over to offer employees the individual attention they need when handling sensitive personal issues.

Even more reduced is the ability to proactively engage with employees, to guide and mentor them through their career paths.

Chatbots can help HR professionals by dramatically amplifying their capabilities. Chatbots can help HR teams stay on top of the substantial responsibilities and achieve the impossible goals they have.

Indeed, chatbots can automate routine processes that take a lot of their time. Recruiting activities such as screening candidates, scheduling interviews and managing the recruiting life cycle for candidates and hiring managers can be substantially automated.

In fact, a startup call RoboRecruiter, has developed a chat bot for automating the end-to-end recruitment process, with improvements in productivity.

Employee onboarding and orientation is another area that is ripe for automation.

New employees account for a high number of HR queries that can be easily automated. Even regular processes such as attendance tracking, goal tracking, performance review, employee surveys and leave balances can be substantially automated.

A company called QuickWork has built chatbots that are automating HR and related business processes for many enterprises.

Getting personnel

To be clear, even though most companies use an HR system to automate many tasks, chatbots make existing systems much more user-friendly than before, dramatically increasing the usage and compliance.

Chatbots help HR become much more accessible to employees. They can provide instant, accurate responses to common queries. The more complex queries can be automatically escalated for human review and response.

Automating the frequently asked queries frees up HR teams to personally handle the more complex queries. This enables them to respond and intervene quickly in sensitive situations. This is especially useful during phases of change-management when businesses roll out major changes in organization or strategy.

These changes lead to a large number of employee queries in a very short time that have to be addressed very quickly to prevent issues from festering.

The increased accessibility is particularly valuable to employees in remote locations, away from headquarters, that are deprived of the ability to have corridor conversations with HR teams.

Chatbots enable HR teams to engage with each employee on an individual, one-on-one basis consistent with their personal situation and issues.

A chatbot can maintain regular, proactive contact with each employee throughout the year to detect any issues that need to be escalated for human engagement.

Tools such as natural language processing and sentiment mining can help chatbot detect anger, frustration, demotivation, exhaustion and related issues.

Based on these observations, chatbots may pull in an HR professional for human engagement.

Chatbots may also proactively recommend vacation time, clubs and activities, or other resources available within or outside the organization. Chatbots may optionally help employees be physically active and healthy by recommending and tracking their daily exercise routines.

Chatbots can provide professional guidance and mentorship to each employee.

Investing in the career growth of each employee is perhaps the highest ROI effort for HR teams and business organizations.

Chatbots can develop customized learning and development plans for each individual. This can include both soft and hard skills that are required for professional success.

Chatbots can reinforce the culture of the organization by recommending appropriate developmental courses. Chatbots can assess employee skills and recommend courses and modules that employees can subscribe to. They can also connect them to mentors within the organization.

OF COURSE, THERE ARE important issues around privacy and confidentiality that must be addressed.

However, HR conversations, by their very nature, tend to involve sensitive and personal information. These issues can be suitably addressed by providing users and organizations adequate control over their data.

Essentially, the chatbot can be an always-on, highly engaged, extremely personalized companion: the perfect HR manager.

HR teams that adopt chatbots will find themselves getting closer to successfully accomplishing the many impossible tasks and conflicting goals that their organizations place on them.

Interesting take. Artificial intelligence is revolutionizing the world for better. With AI you can create a system where according to the scenario, a chatbot replies to your queries. And HR is a process which works on set rules. In such cases, we can easily create an AI solution that can solve queries thrown by the employees and other related parties. It could be clubbed to mobile apps and thus can act as your pocket HR solution.
